Dissolve ingredients (except potassium carbonate) and sparge medium with $100\%~N_2$ gas for 30 - 45 min to make it anoxic. Dispense medium under same gas atmosphere into anoxic Hungate-type tubes or serum vials and autoclave. An anoxic stock solution of the potassium carbonate is autoclaved separately under $80\%~N_2$ and $20\%~CO_2$ gas mixture and thereafter added to the sterile medium. Adjust pH of the complete medium to 6.8 - 7.0. Prior to inoculation add 10 - 20 mg/l sodium dithionite from a 5%~(w/v) stock solution that has been freshly prepared under $100\%~N_2$ gas and sterilized by filtration to reduce the medium.
