1. Dissolve ingredients except sulfur and sulfide and adjust pH to 6.0 with sulfuric acid. Sparge medium with 100% N₂ gas for 30 - 45 min to make it anoxic, dispense under the same gas atmosphere into anoxic Hungate-type tubes or serum vials containing the appropriate amount of sulfur, only to 30% of their volume to allow for a large headspace. Sterilize medium by heating for 2 - 3 hours in a boiling water bath on each of 3 successive days. Before use reduce the medium by adding sulfide from a sterile anoxic stock solution prepared under 100% N₂ gas atmosphere. Check pH and adjust to pH 6.5 - 7.0, if necessary.
2. After inoculation pressurize culture vessels to 1 bar overpressure with a sterile 80% H₂ and 20% CO₂ gas mixture.
