Sparge solution A with $80 \% \mathrm{~N}_{2}$ and $20 \% \mathrm{CO}_{2}$ gas mixture for $30-45$ min to make it anoxic, distribute under same gas atmosphere into anoxic Hungate-type tubes or serum vials and autoclave. Solution B is autoclaved separately under $80 \% \mathrm{~N}_{2}$ and $20 \% \mathrm{CO}_{2}$ gas atmosphere. Solution C should be prepared under $100 \% \mathrm{~N}_{2}$ gas and sterilized by filtration. Solution D is autoclaved under $100 \% \mathrm{~N}_{2}$ gas atmosphere. To complete the medium appropriate amounts of solutions B to D are added to the sterile solution $A$ in the sequence as indicated. Adjust pH of complete medium to 7.2, if necessary.

For DSM 18149: Supplement medium after autoclaving with $1.00 \mathrm{ml} / \mathrm{l}$ Wolin's vitamin solution 10x (see medium 120) sterilized by filtration. Prior to inoculation reduce the complete medium with $10-20 \mathrm{mg} / \mathrm{l}$ sodium dithionite (added from a $5 \% \mathrm{w} / \mathrm{v}$ stock solution freshly prepared under $100 \% \mathrm{~N}_{2}$ gas and filter-sterilized) instead of using cysteine.
For DSM 22742: Supplement medium with $1.00 \mathrm{ml} / \mathrm{I}$ Wolin's vitamin solution 10x (see medium 120) and $0.50 \mathrm{~g} / \mathrm{l}$ Na-thiosulfate added after autoclaving from anoxic stock solutions sterilized by filtration.
